

OrganoHume

Improved Phosphorus Uptake

ANALYSIS (12% HUMIC ACID)

WHAT IS IT?

- OrganoHume is a liquid formulation of extracted humate from leonardite ore.
- OrganoHume is generally combined with existing soil applied liquid or granular starter fertilizers formulations to improve phosphorus uptake, soil CEC and the overall health of the plants.

WHEN & WHY USE IT?

- In the soil, OrganoHume will greatly influence the overall fertility of that soil.
- The use of OrganoHume in liquid foliar application is beneficial because the plant will be able to uptake and utilize the nutrients in the solution more effectively.

WHAT TO EXPECT?

- OrganoHume promotes plant growth and root development, which results in improved plant health and production.
- It also increases and enhances microbial activity aiding in the maintenance of soil health.
- OrganoHume acts as a natural chelating agent, binding to nutrients in the soil. A plant's roots absorb these nutrient compounds which effectively increases the efficiency of the plants uptake of nutrients and decreases nutrient losses caused by leaching.

Application Guidelines

- Apply 2.32 oz per 1000 sq feet.
- OrganoHume is available for use on a wide range of crops, including turf.
- Can be combined with other fertilizers and pesticides.
- A jar test is recommended especially if the desired combination has not been previously used.

*OrganoHume is a trademark of OMEX Agriculture Inc.

Effect of humate along with a good nutritional program on root growth and overall health of grass.

Relative Availability of Phosphorus to the Plant

pH	ORGANIC MATTER		
	<2%	2-5%	5%
<4.5	Very Low	Low	Moderate
4.5 - 6.0	Low	Moderate	High
6.0 - 7.5	Moderate	High	Very High
>7.5	Low	Moderate	High
